

Firmware datasheet

1 Firmware

This document is the technical datasheet of a communication firmware. It describes the structure, features and interfaces of a loadable communication firmware, running on a netX SoC based device. Each communication firmware consists of several software components. The document lists the technical data and limitations of each component separately. Furthermore 3rd party software components and their licenses are listed in this document.

A Loadable Firmware (LFW) is provided as single binary file (*.nxf, *.nxi) or set of binaray files (*.nxi + *.nxe). Each binary, respectively set of binary files, comes with a dedicated firmware datasheet document.

More information with a higher level of details, can be found in various additional documents. Primarily the Dual Port Memory Manuals and the Protocol API Manuals.

1.1 File information

| Firmware | EtherNet/IP Adapter firmware |
|-----------|------------------------------|
| File name | R160H000.nxf |
| Version | V3.8.0.0 |

Table 1. File information

1.2 Requirements

For operation, the firmware requires the following hardware environment and parameters.

| Requirements | Description |
|------------------|---|
| ASIC | netX51 |
| Hardware design | netRAPID Module |
| 2nd Stage Loader | V1.6.0.0 or newer |
| Device data | Device data provided by the security memory or via DDP - Device Data Provider mailbox service |
| MAC addresses | MAC 0: EtherNet/IP and IP communication |
| | MAC 1: LLDP communication |
| | MAC 2: LLDP communication MAC 3: Ethernet API, if activated |

Table 2. Requirements

2 Firmware interfaces and features

The following figure illustrates the internal structure and all available interfaces of the firmware.

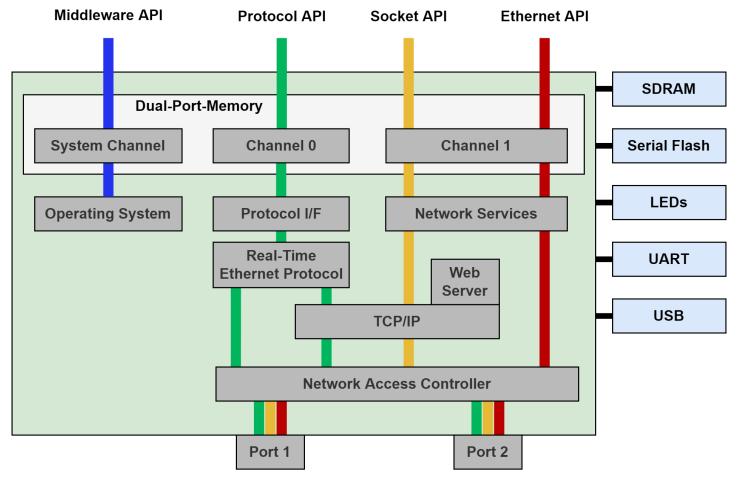

Figure 1. Firmware structure

2.1 Dual-Port-Memory

The Dual Port Memory (DPM), physically located inside the netX SoC, is the central interface between the communication firmware and the user application. It is physically accessed by an external parallel bus, serial SPI interface or an internal data bus. The DPM features a linear address space. The address space is partitioned into several consecutive sections, called "channels". The user application and the communication firmware exchange data, commands and notifications by reading from and writing to the DPM. Each DPM channel is mapped to dedicated firmware functionality and allows usage of respective APIs. You find detailed information about the DPM layout, address spaces and generic services in the Dual Port Memory Manuals.

| Channel | API | Manual | |
|-----------|-------------------------|--|--|
| System | Middleware API | Manual "netX Dual-Port Memory Interface DPM" and "netX Dual-Port Memory packet-based services" | |
| Channel 0 | EtherNet/IP Adapter API | Manual "EtherNet/IP Adapter" | |
| Channel 1 | Socket API | Manual "Socket Interface - Packet Interface" | |
| Channel 1 | Ethernet API | Manual "Ethernet Interface - Packet Interface" | |

Table 3. Dual-Port-Memory layout

2.2 EtherNet/IP

This firmware offers EtherNet/IP Adapter features and an API to access them.

2.2.1 Technical data

The following technical data apply to EtherNet/IP Adapter features.

| Max. number of input data 504 bytes per assembly instance Max. number of output data 504 bytes per assembly instance Max. number of assembly instances 64 10 connection types (implicit) Exclusive owner Listen only Listen only 10 connection trigger types Cyclic Application triggered Change of state 10 connection RPI (OZT / TZO) min. 1ms, max. 32,767ms* | Feature | Value |
|--|--------------------------------------|--|
| Max. number of assembly instances 64 IO connection types (implicit) Exclusive owner Listen only Input only IO connection trigger types Cyclic Application triggered Change of state IO connection RPI (O2T / T2O) min. 1ms, max. 32,767ms* * Depending on the number of parallel connections and sizes of input and output data. Explicit messages Connected and unconnected Unconnected Message Manager (UCMM) Supported Max. number of connections Target Class 1: 32 Target Class 3: 8 UCMM: 8 Predefined standard objects Identity Object (0x01) Message Router Object (0x02) Assembly Object (0x49) Connection Manager (0x06) DLR Object (0x47) QoS Object (0x48) TCP/IP, Interface Object (0xF5) Ethernet Link Object (0xF6) Time Sync Object (0x43) LLDP Management Object (0x109) Max. number of user-specific objects 20 Supported features TCP/IP, IDP/IP DHCP, BOOTP Device Level Ring (DLR) - Media Redundancy Address Conflict Detection (ACD) Quality of Service CIP Reset services - Identity Object Reset service of type 0 and 1 QuickConnect LLDP, SNMP (LLDP MIB) CIP Sync Ethernet Speed 10 and 100 MBit/s Ethernet Duplex Modes Half Duplex, Full Duplex, Auto-Negotiation | Max. number of input data | 504 bytes per assembly instance |
| Connection types (implicit) Exclusive owner Listen only Input only | Max. number of output data | 504 bytes per assembly instance |
| Listen only Input only IO connection trigger types Cyclic Application triggered Change of state IO connection RPI (O2T / T2O) min. 1ms, max. 32,767ms* | Max. number of assembly instances | 64 |
| Input only | IO connection types (implicit) | Exclusive owner |

| Max. number of user-specific objects Supported features TCP/IP, UDP/IP DHCP, BOOTP Device Level Ring (DLR) - Media Redundancy Address Conflict Detection (ACD) Quality of Service CIP Reset services - Identity Object Reset service of type 0 and 1 QuickConnect LLDP, SNMP (LLDP MIB) CIP Sync Ethernet Speed 10 and 100 MBit/s Ethernet Duplex Modes Half Duplex, Full Duplex, Auto-Negotiation | | Time Sync Object (0x43) |
| Supported features TCP/IP, UDP/IP DHCP, BOOTP Device Level Ring (DLR) - Media Redundancy Address Conflict Detection (ACD) Quality of Service CIP Reset services - Identity Object Reset service of type 0 and 1 QuickConnect LLDP, SNMP (LLDP MIB) CIP Sync Ethernet Speed 10 and 100 MBit/s Half Duplex, Full Duplex, Auto-Negotiation | | LLDP Management Object (0x109) |
| DHCP, BOOTP Device Level Ring (DLR) - Media Redundancy Address Conflict Detection (ACD) Quality of Service CIP Reset services - Identity Object Reset service of type 0 and 1 QuickConnect LLDP, SNMP (LLDP MIB) CIP Sync Ethernet Speed 10 and 100 MBit/s Ethernet Duplex Modes Half Duplex, Full Duplex, Auto-Negotiation | Max. number of user-specific objects | 20 |
| Device Level Ring (DLR) - Media Redundancy Address Conflict Detection (ACD) Quality of Service CIP Reset services - Identity Object Reset service of type 0 and 1 QuickConnect LLDP, SNMP (LLDP MIB) CIP Sync Ethernet Speed 10 and 100 MBit/s Ethernet Duplex Modes Half Duplex, Full Duplex, Auto-Negotiation | Supported features | TCP/IP, UDP/IP |
| Address Conflict Detection (ACD) Quality of Service CIP Reset services - Identity Object Reset service of type 0 and 1 QuickConnect LLDP, SNMP (LLDP MIB) CIP Sync Ethernet Speed 10 and 100 MBit/s Ethernet Duplex Modes Half Duplex, Full Duplex, Auto-Negotiation | | DHCP, BOOTP |
| Quality of Service CIP Reset services - Identity Object Reset service of type 0 and 1 QuickConnect LLDP, SNMP (LLDP MIB) CIP Sync Ethernet Speed 10 and 100 MBit/s Ethernet Duplex Modes Half Duplex, Full Duplex, Auto-Negotiation | | Device Level Ring (DLR) - Media Redundancy |
| CIP Reset services - Identity Object Reset service of type 0 and 1 QuickConnect LLDP, SNMP (LLDP MIB) CIP Sync Ethernet Speed 10 and 100 MBit/s Ethernet Duplex Modes Half Duplex, Full Duplex, Auto-Negotiation | | Address Conflict Detection (ACD) |
| QuickConnect LLDP, SNMP (LLDP MIB) CIP Sync Ethernet Speed 10 and 100 MBit/s Ethernet Duplex Modes Half Duplex, Full Duplex, Auto-Negotiation | | Quality of Service |
| LLDP, SNMP (LLDP MIB) CIP Sync Ethernet Speed 10 and 100 MBit/s Ethernet Duplex Modes Half Duplex, Full Duplex, Auto-Negotiation | | CIP Reset services - Identity Object Reset service of type 0 and 1 |
| CIP Sync Ethernet Speed 10 and 100 MBit/s Ethernet Duplex Modes Half Duplex, Full Duplex, Auto-Negotiation | | QuickConnect |
| Ethernet Speed 10 and 100 MBit/s Ethernet Duplex Modes Half Duplex, Full Duplex, Auto-Negotiation | | LLDP, SNMP (LLDP MIB) |
| Ethernet Duplex Modes Half Duplex, Full Duplex, Auto-Negotiation | | CIP Sync |
| | Ethernet Speed | 10 and 100 MBit/s |
| Ethernet MDI modes MDI, MDI-X, Auto-MDIX | Ethernet Duplex Modes | Half Duplex, Full Duplex, Auto-Negotiation |
| | Ethernet MDI modes | MDI, MDI-X, Auto-MDIX |

Firmware datasheet www.hilscher.com
© Hilscher 2023

| Feature | Value |
|----------------------|-------------------------|
| Data transport layer | Ethernet II, IEEE 802.3 |

Table 4. Technical data

2.2.2 Configuration

- by packets (e.g via Dual-Port-Memory mailbox)
- by database (two files named config.nxd and nwid.nxd) created by Communication Studio or Sycon.NET

2.2.3 Restrictions and limitations

NOT supported are:

- Tags [common mechanism to address typed PLC data using string identifiers]
- CIP Motion
- CIP Safety

This means the protocol stack itself does not implement the safety application layer. This has to be implemented on the host application side. However, the protocol stack supports all EtherNet/IP features required to build a device that is CIP Safety capable.

2.3 Socket API

The Socket API provides access to the integrated IP stack. Users can implement custom or standard TCP and UDP based protocols on the application side. Both server and client applications are possible. The Socket API has a POSIX socket like interface.

2.3.1 Technical data

The following technical data apply to LWIP component.

| Feature | Description |
|--|--|
| Number of possible parallel active sockets | Default: 8 Can be configured via "Number of sockets for Socket API usage" in tag list from 1 up to 64. |
| Number of possible parallel Socket API services | Default: 4 Can be configured via "Number of Socket API Services at DPM level" in tag list from 1 up to 8. |
| Maximum transmission unit (MTU) size | up to 1500 bytes |
| Protocols | ■ IPv4 protocol |
| | ■ TCP |
| | ■ UDP |
| | netident - Hilscher specific protocol to configure IP stack. netIdent can be disabled via "LWIP netident behavior" in tag list. |
| Socket modes | Blocking |
| | ■ Non/Blocking |
| UDP ports | 25383 (Hilscher netident) |

Table 5. Technical data: Socket API

The maximum values for number of possible parallel active sockets and number of possible parallel Socket API services are configuration parameters in the tag list of the firmware.

Each of these features requires resources and the configuration parameters have to be set in order to not exceed the available resource (e.g. RAM) of a device. The same applies for protocol specific configuration parameters of the tag list as well.

All these configuration parameters compete with each other against the same limited available memory.

2.3.2 Restrictions and limitations

As Socket API is not the main functionality of this firmware, the possible transmission rates will be influenced by higher priority communication tasks and can't be guaranteed.

IPv6 protocol is not supported

www.hilscher.com © Hilscher 2023

2.4 Ethernet API

The Ethernet API allows RAW Ethernet frame handling by the user application. It is an independent network node with its own MAC address. While it is connected to the same physical interface, it operates in parallel to the Real Time Ethernet protocol. Typically, the Ethernet API is used on host systems which feature own TCP/IP Stacks, like Linux based application processors.

This functionality needs to be explicitly enabled in the firmware tag list tag "Ethernet NDIS support"

2.4.1 Technical data

The following technical data apply to the Ethernet driver component.

| Feature | Description | |
|---|--|--|
| Maximum frame length | 1518 Bytes, starting with first byte of destination MAC address and ending with last byte of data | |
| Size of receive/transmit queue | 4 telegrams each | |
| Data transport layer | Ethernet II, IEEE 802.3 | |
| Amount of supported multicast MAC addresses | either no multicast or all multicast mac addresses will be forwarded | |
| Supported features | Sending and receiving of Ethernet frames | |
| | Sending and receiving of Ethernet multicast frames (after activating the specific multicast MAC address) | |

Table 6. Technical data: Ethernet API

2.4.2 Restrictions and limitations

The following general limitations apply:

- The underlying switch in this EtherNet/IP firmware might apply filtering to the frames to protect the EtherNet/IP network from any disturbance due to frames sent or received by the host application. This means that specific multicast or broadcast frames received by the netX may not be forwarded to the Ethernet application. In addition, specific frames generated by the Ethernet application may not be sent to the network. For this firmware, the following frames/protocols are known to be blocked (the list may be incomplete):
 - all CIP Transport Class 0/1 messages (UDP Port 2222)
- The size of the receive and transmit queue is limited (see Technical data above). If more frames are received from the network by the switch integrated in the firmware, these frames are silently dropped.
- While handling of multicast MAC addresses it may be possible that frames with unexpected multicast MAC addresses are handed over to the Ethernet application.
- This API is not designed to be used by Ethernet application to implement any real-time capable protocol or application. This is due to its design and internal handling in the netX firmware whose main purpose is always executing the EtherNet/IP Industrial Ethernet protocol.
- Using the Ethernet API will increase the overall CPU usage by the firmware resulting in higher CPU load especially in case of high network load.

Firmware datasheet www.hilscher.com
© Hilscher 2023

2.5 Web server

This firmware has an integrated web server. If desired, the web server can be disabled in firmware tag list via tag "Web server (HTTP) configuration". The web server functionality is described in API Manual "servX HTTP Server - Content Generation".

2.5.1 Technical data

The data below applies to the web server component.

| Feature | Description |
|------------------------|---|
| Integrated modules and | Firmware Update - Enables uploading a new firmware update file |
| dispatch configuration | \fwupdate |
| | Reset - Initiates a netX reset |
| | ■ \reset |
| TCP Port | Default: 80 (http) Can be changed in firmware tag list tag "Web server (HTTP) configuration" (*1) |

Table 7. Technical data: Web interface

(*1) Changing "TCP Port" to a port number that is also used by another component inside the firmware, will lead to undefined firmware behavior and shall be avoided.

2.5.2 Restrictions and limitations

HTTPS is not supported.

2.6 General firmware features

In addition to protocol and component specific features, which are described in other parts of this document, the following general features are provided by this firmware:

| Feature | Description | |
|---------------------|---|--|
| File system | 8.3 FAT file system (not fail-safe) | |
| Diagnosis interface | UART Can be disabled via "UART Diagnostics Interface" in tag list. | |
| Diagnosis interface | USB Can be disabled via "USB Diagnostics Interface" in tag list. | |

Table 8. General firmware features

2.6.1 IP ports used by the firmware and its components

The firmware uses the following ports for IP communication by default:

| Protocol | Ports |
|----------|---|
| UDP | 2222 (EtherNet/IP Class 0/1), 44818 (EtherNet/IP Class 3 and UCMM), 25383 (Hilscher netident), 68 (DHCP client), 161 (SNMP), 319 and 320 (CIP Sync) |
| TCP | 44818 (EtherNet/IP encapsulation protocol), 80 (http) |

Table 9. Summary of IP ports used by firmware

3 Taglist

The Taglist allows users to configure and customize the protocol firmware. The taglist is part of the firmware binary and can be modified by the taglist editor utility.

| Name | Description | |
|---|--|--|
| LED | This tag is used to modify physical LED connection settings in the firmware. | |
| Remanent Data Responsibility | With this tag, you can adjust whether loading and storing of remanent data is entirely performed by the communication firmware or by the host application. | |
| DDP Mode after firmware startup | With this tag, you can control the DDP mode on firmware startup. | |
| Phy enable timeout after firmware startup | With this tag you can specify a maximum delay until Phys will be activated by firmware. | |
| Ethernet NDIS support | With this tag you can enable NDIS support for the Ethernet API. | |
| UART Diagnostics Interface | UART interface of netX Diagnostics and Remote Access component. | |
| USB Diagnostics Interface | USB interface of netX Diagnostics and Remote Access component. | |
| Web server (HTTP) configuration | Sets the number of the TCP port that the web server listens on. | |
| LWIP Ports for IP 0.0.0.0 | With this tag you can enable IP ports for usage with Broadcast communication when IP is 0.0.0.0. | |
| LWIP netident behaviour | With this tag, you can adjust whether the firmware shall activate the Hilscher netident protocol, which is build-in in the IP stack, or not. | |
| Socket API Quantity Structure | adjust the resources allocated and provided by the build-in IP stack. | |
| Ethernet/IP Product Information | When this tag is enabled, the contained CIP Product Information will supercede that from the database or packet configuration. | |
| DLR Protocol | With this tag you can disable Ethernet/IP DLR protocol. | |

Table 10. Taglists of firmware R160H000.nxf

Note that the Ethernet/IP Product Information tag can only be used in case the protocol stack is configured using a database. For all other configuration methods, this tag is ignored.
